REPLY TO  
ATTENTION OF:  
NEEDED

SEP 17 1979

Honorable Edward J. King  
Governor of the Commonwealth of  
Massachusetts  
State House  
Boston, Massachusetts 02133

Dear Governor King:

I am forwarding to you a copy of the Townsend Harbor Dam Phase I Inspection Report, which was prepared under the National Program for Inspection of Non-Federal Dams. This report is presented for your use and is based upon a visual inspection, a review of the past performance and a brief hydrological study of the dam. A brief assessment is included at the beginning of the report. I have approved the report and support the findings and recommendations described in Section 7 and ask that you keep me informed of the actions taken to implement them. This follow-up action is a vitally important part of this program.

A copy of this report has been forwarded to the Department of Environmental Quality Engineering, the cooperating agency for the Commonwealth of Massachusetts. In addition, a copy of the report has also been furnished the owner, Hollingsworth & Vose Co., Townsend Road, West Groton, Massachusetts 01472.

Copies of this report will be made available to the public, upon request, by this office under the Freedom of Information Act. In the case of this report the release date will be thirty days from the date of this letter.

I wish to take this opportunity to thank you and the Department of Environmental Quality Engineering for your cooperation in carrying out this program.

Sincerely yours,

*Max B. Scheider*  
MAX B. SCHEIDER  
Colonel, Corps of Engineers  
Division Engineer

PHASE I INSPECTION REPORT  
NATIONAL DAM INSPECTION PROGRAM

PHASE I INSPECTION REPORT  
NATIONAL DAM INSPECTION PROGRAM

Identification No. : MA 00138  
Name of Dam: TOWNSEND HARBOR DAM  
Town: TOWNSEND  
County and State: MIDDLESEX, MA  
Stream: SQUANNACOOK  
Date of Inspection: 15 NOVEMBER 1978

BRIEF ASSESSMENT

Townsend Harbor Dam consists of a 100 foot long earth embankment 11 feet high at the right, a 92 foot long stone masonry spillway 8 feet high at the center and 57 foot long stone masonry wall retaining apparent fill at the left side of the dam. The outlet works of the reservoir, a mill-race, is to the left of the stone masonry wall. The millrace has an abandoned concrete control structure near its mid-length, a concrete overflow near the three-quarter point and a concrete control structure with stop logs at the discharge end which is approximately 200 feet downstream of the spillway.

The dam is in fair condition. Slight seepage was observed at the right end of the spillway and from under the old grist mill building. Brush, trees and debris are present on the dam and dike embankments and in the downstream channel.

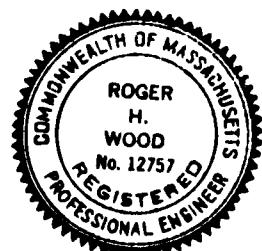

Based on the size, small, and hazard classification, significant, in accordance with the Corps of Engineers Guidelines, the spillway test flood is the 1/4 Probable Maximum Flood (1/4 PMF). The test flood peak outflow was estimated to be 14,610 cfs and would result in overtopping the dam by approximately 7.5 feet; however, under such a flooding condition the dam would be essentially submerged by tailwater. Hydraulic analysis indicates that the spillway will only pass 43 percent of the test flood.

Recommended additional investigations by the Owner include a detailed hydrologic-hydraulic study of spillway capacity, an investigation of the protection of the millrace dike and an investigation of seepage at the grist mill foundation and at the right end of the spillway. Recommended remedial measures include the cutting of brush and trees at the dam, dike and discharge channel, the repair of locally eroded areas and spillway apron and the establishment of formal maintenance program, operational procedures and emergency preparedness plan and warning system. These recommendations and remedial measures as delineated in Section 7 of the report should be undertaken within one year of receipt of the report by the Owner.

CAMP DRESSER & MCKEE INC.

*Roger H. Wood*

Roger H. Wood  
Vice President

This Phase I Inspection Report on Townsend Harbor Dam has been reviewed by the undersigned Review Board members. In our opinion, the reported findings, conclusions, and recommendations are consistent with the Recommended Guidelines for Safety Inspection of Dams, and with good engineering judgement and practice, and is hereby submitted for approval.

Chief, Engineering Division

## PREFACE

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation, and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I Investigation; however, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structure and may obscure certain conditions which might otherwise be detectable if inspected under the normal operating environment of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspection can there be any chance that unsafe conditions be detected.

Phase I Investigations are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the test flood is based on the estimated "probable maximum flood" for the region (greatest reasonably possible storm runoff), or a fraction thereof. Because of the magnitude and rarity of such a storm event, a finding that a spillway will not pass the test flood should not be interpreted as necessarily posing a highly inadequate condition. The test flood provides a measure of relative spillway capacity and serves as an aide in determining the need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and the downstream damage potential.

LOCATION MAP  
USGS QUADRANGLE  
TOWNSEND, MASS. - N.H.

APPROX. SCALE: 1" = 2000'

PHASE 1 INSPECTION REPORT  
NATIONAL DAM INSPECTION PROGRAM

TOWNSEND HARBOR DAM  
MA 00138

SECTION 1: PROJECT INFORMATION

1.1 General

- a. Authority - Public Law 92-367, August 8, 1972, authorized the Secretary of the Army, through the Corps of Engineers, to initiate a national program of dam inspection throughout the United States. The New England Division of the Corps of Engineers has been assigned the responsibility of supervising the inspection of dams within the New England region.

Camp Dresser & McKee Inc. has been retained by the New England Division to inspect and report on selected dams in the State of Massachusetts. Authorization and notice to proceed was issued to Camp Dresser & McKee Inc. under letters of 12 July 1978 and 23 October 1978 from Colonel John P. Chandler, Corps of Engineers. Contract No. DACW 33-78-C-0354 has been assigned by the Corps of Engineers for this work. Haley and Aldrich, Inc. has been retained by Camp Dresser & Inc. for soils and geological portions of the work.

- b. Purpose - The primary purpose of the investigation is to:
- (1) Perform technical inspection and evaluation of non-federal dams to identify conditions which threaten the public safety and thus permit correction in a timely manner by non-federal interests.
  - (2) Encourage and assist the states to initiate quickly effective dam safety programs for non-federal dams.
  - (3) Update, verify and complete the National Inventory of Dams.

PHASE 1 INSPECTION REPORT  
NATIONAL DAM INSPECTION PROGRAM

TOWNSEND HARBOR DAM  
MA 00138

SECTION 1: PROJECT INFORMATION

1.1 General

- a. Authority - Public Law 92-367, August 8, 1972, authorized the Secretary of the Army, through the Corps of Engineers, to initiate a national program of dam inspection throughout the United States. The New England Division of the Corps of Engineers has been assigned the responsibility of supervising the inspection of dams within the New England region.

Camp Dresser & McKee Inc. has been retained by the New England Division to inspect and report on selected dams in the State of Massachusetts. Authorization and notice to proceed was issued to Camp Dresser & McKee Inc. under letters of 12 July 1978 and 23 October 1978 from Colonel John P. Chandler, Corps of Engineers. Contract No. DACW 33-78-C-0354 has been assigned by the Corps of Engineers for this work. Haley and Aldrich, Inc. has been retained by Camp Dresser & Inc. for soils and geological portions of the work.

- b. Purpose - The primary purpose of the investigation is to:
- (1) Perform technical inspection and evaluation of non-federal dams to identify conditions which threaten the public safety and thus permit correction in a timely manner by non-federal interests.
  - (2) Encourage and assist the states to initiate quickly effective dam safety programs for non-federal dams.
  - (3) Update, verify and complete the National Inventory of Dams.

## 1.2 Description of Project

- a. Location - Townsend Harbor Dam is located on the Squannacook River, approximately 95 feet upstream of South Harbor Road and adjacent to Main Street in the Town of Townsend, Massachusetts, as shown on the report's location map. Water impounded by the dam is called Harbor Pond.
- b. Description of Dam and Appurtenances - Townsend Harbor Dam consists of a 92.2-ft. long, 8.3-ft. high stone-masonry overflow spillway flanked on the right by a 100 foot long low earth embankment and on the left by an area of apparent fill retained by a 57-ft. long stone-masonry wall.

A 17.6-ft. wide millrace runs parallel to the Squannacook River around the left abutment area past old mill buildings and rejoins the downstream channel over 200 feet below the dam. A 16.3-ft. long railroad bridge forms the entrance to the millrace, which is a stone-masonry-walled channel upstream of South Harbor Road and is a concrete channel downstream. A 3.9-foot-wide, stop-log controlled concrete outlet at the end of the millrace allows the flow to return to the Squannacook River.

Short stone masonry walls extend about 8 feet from the right spillway training wall along the upstream and downstream faces of the right dam embankment. Beyond these walls, extending to a total length of approximately 100 feet from the spillway, there is an irregularly-shaped grass and brush-covered earth embankment. The embankment height varies from a maximum of approximatley 13 ft. at the spillway to a junction with natural ground in a private yard. The embankment crest is about 2.7 feet above the level of the spillway crest.

To the left of the spillway, the apparent filled area is relatively level at 2.8 feet above the spillway crest and is bounded by the left spillway and channel walls to the south, a stone-masonry upstream wall to the west, the millrace to the north, and South Harbor Road to the east. Most of the surface is grass and weeds, but there is one large wood-frame building called "The Cooperage" that projects over the downstream river channel.

Downstream of South Harbor Road the millrace generally parallels the river channel, with its river-side bank about 12 feet above the river channel. An 80-ft. long section of this bank, between an old wood frame grist mill near South Harbor Road and the concrete millrace outlet structure near another mill building, functions as an earth dike. The dike has a crest width that varies from 10 to 20 feet, an upstream concrete wall, and a partial downstream stone-masonry wall. Most of the millrace dike crest has a cover of grass and weeds with some trees and brush, while the gradual slope from the downstream wall to the river channel has more trees and brush.

- c. Size Classification - Townsend Harbor Dam has a height of approximately 11 feet and a storage capacity of 273 acre-feet at the top of the dam. According to guidelines established by the Corps of Engineers, the dam is classified in the small category.
  - d. Hazard Classification - Based on the results of the dam failure analysis included in Section 5 of this report, failure of the dam could jeopardize a few lives due to the presence of a building on the left side of the downstream channel. The dam is, therefore, classified in the significant hazard category.
  - e. Ownership - The dam and millrace have been owned by Hollingsworth & Vose Company for the past 18 years. The previous owner is reported to be Townsend Harbor Investments Inc., from which Hollingsworth & Vose Co. purchased the property. The address of the present owner is: Hollingsworth & Vose Company, Townsend Road, West Groton, Massachusetts, 01472. Mr. A.E. Irelan at the above address is the owner's representative.
  - f. Operator - Operation of the dam is the responsibility of Mr. A.E. Irelan of Hollingsworth & Vose Co. His address is Hollingsworth & Vose Co., Townsend Road, West Groton, Massachusetts, 01472 (phone 617/448-3311).
  - g. Purpose of Dam - A dam was originally constructed at this general area in 1733 as a water supply for a saw mill which eventually became a grist mill. In 1870, the present dam was constructed to provide additional power for the Spaulding Leatherboard Company. The present owner utilizes the dam as a water reservoir to supplement extreme dry-weather river flow.
  - h. Design and Construction History - There are no records of the design or construction of this dam. A newspaper account and plaque at the site indicate that a dam was originally built in 1733 in this area. The present dam was constructed in 1870 and rebuilt or repaired after being damaged in 1936 and 1938.
  - i. Normal Operational Procedures - There is no formally-established routine for operation of the dam. Mr. Irelan stated that Harbor Pond is maintained at approximate spillway crest elevation year-round with stop logs located at the millrace outlet. During very dry periods, the operator increases the flow through the millrace by removing the stop logs.
- j.3 Pertinent Data - Elevations used in this report are on National Geodetic Vertical Datum (NGVD), formerly referred to as Mean Sea Level Datum (MSL). The elevations previously established at the dam site and shown on the plan included in Appendix B are on NGVD and agree with those shown on the USGS Quadrangle, Townsend, Mass., 1965.

a. Drainage Area - The drainage area tributary to the dam site is 58.3 square miles and is characterized by moderately-forested, lightly-developed rolling terrain. In the vicinity of Harbor Pond, the terrain is flat and swampy. Harbor Pond accounts for approximately 0.1 percent of the total drainage area.

b. Discharge at Dam Site - There are no records of discharges at the dam site, but Squannacook River discharges are recorded at USGS Gage Number 01096000 located approximately 2 miles downstream of the dam site.

- (1) Outlet works size-----3.9 ft. wide by 2.8 ft. high box outlet
- (2) Maximum known flood at damsite-----Unknown
- (3) Ungated spillway capacity at top of dam  
1,430 cfs @ 270.0 elev.
- (4) Ungated spillway capacity at test flood elevation

| (8) Cutoff  | Unknown       | Unknown                           |
| (9) Grout curtain   | Probably none | Probably none                     |
| h. <u>Diversion and Regulating Tunnel</u>   | -----         | None                              |
| i. <u>Spillway</u>  |               |                                   |
| (1) Type  | -----         | Stone masonry                     |
| (2) Length of weir  | -----         | 92.2 ft.                          |
| (3) Crest elevation   | -----         | 267.3 MSL                         |
| (4) Gates   | -----         | None                              |
| (5) U/S Channel   | -----         | None                              |
| (6) D/S Channel   | -----         | 85-ft. wide river at 0.0015 slope |
| j. <u>Regulating Outlets</u> - Flow at the dam can be regulated by insertion or removal of stop logs at the control structure at the downstream end of the millrace. The discharge opening is 3.9 feet wide and, without stop logs, is 6.1 feet high, with an estimated invert elevation of 263.1. Normally, there are 3.3 feet of stop logs at the outlet, setting the normal weir crest at elevation 266.4. There is an uncontrolled overflow spillway from the millrace to the Squannacook River located approximately 23 feet upstream from the downstream millrace control structure. The overflow spillway crest is at elevation 268.3 and is approximately 18 feet long. |               |                                   |

## SECTION 2. ENGINEERING DATA

- 2.1 Design Records - No design records were located for the Townsend Harbor Dam.
- 2.2 Construction Records - No records of the original construction were located.
- 2.3 Operation Records - No operational records were located for the dam.
- 2.4 Evaluation
  - a. Availability - No records for the dam other than prior inspection reports were located.
  - b. Validity - There are no known design, construction or operating records.
  - c. Adequacy - The absence of known records requires that the evaluation of the dam during this investigation be based on the visual examination described in the following section.

## SECTION 3: VISUAL INSPECTION

### 3.1 Findings

- a. General - The Phase I visual examination of Townsend Harbor Dam was conducted on 15 November 1978. In general, the structures were observed to be in fair condition. It should be noted that the only pond drain for this structure is the millrace channel.

Visual inspection checklists for the dam are included in Appendix A, and selected photographs are given in Appendix C.

- b. Dam and Spillway - The spillway, and the earth embankments on each side of it, show no visual evidence of major lateral movement or settlement. The open-joint stone-masonry spillway and the left wall between the dam and South Harbor Road appear to be stable. The walls to the right of the spillway are in fair condition. Minor seepage is present at the juncture of the spillway and downstream wall parallel to the crest of the embankment, while portions of the flared downstream wall are displaced. The earth embankment located to the right of the spillway is generally in fair condition, with no visual evidence of major erosion or seepage.

The following specific items were noted:

1. Quarry stone debris just downstream of the spillway on the left side appears to be apron stone which may have been broken or dislodged from the apron and moved downstream. It appears that some of the pieces from the apron have been used as protection for the right wing wall of the South Harbor Road bridge.
2. Much of the right embankment surface is mowed lawn, but there is considerable growth of brush and trees on the downstream face and near the spillway. Leaves and branches have been dumped on part of the downstream face.
3. There is local slight erosion of the right embankment at the end of the short downstream masonry wall.
4. There is slight water flow through joints, as shown in Photo 12, in the right downstream masonry wall which is parallel to the embankment crest.
5. The crest of the right dam embankment is irregular, and is slightly low immediately behind the masonry wall at the spillway.
6. There is some brush growth in the channel downstream of the spillway.
7. The right downstream flared stone masonry wall has areas of displaced stones.

- c. Appurtenant Structures - The stone-masonry wall just upstream of the millrace entrance at the railroad bridge is in good condition. Heavy brush, however, was observed along both sides. The millrace dike is in poor condition, due to extensive erosion and other deficiencies. The upstream millrace control structure was in good condition, but the stop-log guides were in poor condition. No stop logs were observed. The millrace downstream of South Harbor Road and the downstream control structure are of concrete and are in good condition. Submerged stop logs were observed at this structure during the site visit. The overflow spillway on the right side of the millrace is in good condition with minor vegetation at the crest. On the left side of the channel just upstream of the downstream control structure there is evidence of a former continuation of the millrace through the buildings located downstream along the left river bank.

The following additional specific items were noted:

1. The millrace dike has major erosion loss near the corner of the old grist mill and behind about half the length of the upstream stone-masonry wall. The erosion appears to have been at least partly the result of overtopping.
  2. Part of the millrace dike crest has brush and tree growth, as shown in Photos 7, 8, and 9, while the eroded portions are bare of any vegetation.
  3. There is a large, partly stone-filled, depression immediately below the millrace dike overflow spillway, apparently the result of scour from past spillway flows.
  4. Slight seepage flow is emerging from under the grist mill building next to the downstream river channel. This flow may originate at the other end of the building basement, where there would have been a gated waterway connection to the millrace.
- d. Reservoir Area - The area around Harbor Pond is moderately developed. There appear to be no structures below elevation 270, but there are approximately 35 structures below elevation 280. The side slopes of the pond are generally flat and swampy. There is no apparent potential for significant landslides into the pond which could create waves that might overtop the dam. No conditions were noted which could result in a sudden increase in sediment load in the pond.

The Squannacook River enters Harbor Pond approximately 3,500 feet upstream (west) of the dam. The channel meanders slightly, and its slope varies from 0.05 percent near the pond to 0.13 percent near the center of the Town of Townsend.

- e. Downstream Channel - The Squannacook River downstream of the dam is approximately 85 to 100 feet wide, appears to be unobstructed, and has very little development along its banks. The slope is approximately 0.13 percent. There appear to be two other dams on the Squannacook River before its confluence with the Nashua River, approximately 7 miles downstream.

### 3.2 Evaluation

The masonry spillway, side embankments and appurtenances appear to be performing satisfactorily at the present time. The seepage observed at the right masonry wing wall adjacent to the spillway, however, could cause future problems if allowed to continue. Furthermore, the limited millrace dike freeboard and partially-unprotected dike embankment appear to provide potential for failure under conditions of water levels which overtop the embankments.

#### SECTION 4: OPERATIONAL PROCEDURES

- 4.1 Procedures - There is no formal procedure for operation of the dam. On an informal basis, the Owner attempts to control flow over the spillway by removing stop logs at the downstream end of the millrace. During extreme low flow, the Owner removes additional stop logs, releasing water impounded by the dam and spillway for his use as process water at a downstream mill.
- 4.2 Maintenance of Dam - There is no established formal maintenance program for this dam. The operator indicated that the dam is inspected twice a year and maintenance is performed on a demand basis.
- 4.3 Maintenance of Operating Facilities - There is no formal procedure for maintenance of operating facilities (millrace control structures).
- 4.4 Description of Any Warning System in Effect - There is no established warning system or emergency preparedness plan in effect for the dam. The operator indicated that the dam is observed during periods of high water.
- 4.5 Evaluation - Formal operational procedures should be established for high-flow conditions at the dam. Formal maintenance programs, warning systems and emergency preparedness plans should also be established. Periodic observation should be made, and the tree and brush growth at the embankments should be brought under control. Maintenance of the dam should be performed at regular intervals.

## SECTION 5: HYDRAULIC/HYDROLOGIC

### 5.1 Evaluation of Features

- a. General - Harbor Pond is formed by the Townsend Harbor Dam on the Squannacook River, which is a tributary of the Nashua River approximately 7 miles downstream of the dam. The surface area of the pond is approximately 44 acres at spillway crest and approximately 197 acres at the top of the dam. The dam impounds approximately 116 acre-feet of water at spillway crest and approximately 273 acre-feet at the top of the dam.

The stone masonry spillway, at crest elevation 267.3, is 92.2 feet long. The low point of the right embankment of the dam is at elevation 270. The left embankment, at elevation 270.1, extends 57 feet from the dam to the railroad bridge at the entrance to the millrace. The millrace entrance consists of a box culvert 16.3 feet wide, 6.6 feet high and 11.5 feet long, with an invert elevation of 263.1.

There are several means of discharge from the millrace, depending on the water surface elevation. The invert of the normal discharge opening, 3.9 feet wide and 6.1 feet high, is 263.1. However, the 3.3 feet of stop logs normally maintained in this opening sets the normal operating weir at 266.4. The overflow spillway upstream of the normal discharge opening is at elevation 268.1 and is 18 feet long. The walls on both sides of the overflow spillway form an additional 44.4 feet of weir at elevation 269.2. The top of the wall above the normal discharge opening forms an additional 15-foot weir at elevation 270.2. The side wall of the remainder of the millrace, upstream of South Harbor Road, is at elevation 272.1.

- b. Design Data - No hydraulic/hydrologic design data are available for the dam.
- c. Experience Data - A newspaper report indicates that the dam and South Harbor Road bridge were "washed out" during the 1936 flood and were rebuilt in 1937. The report further states that the dam was repaired after the 1938 hurricane.

USGS Gaging Station 01096000 has recorded Squannacook River flows approximately 2 miles downstream of the dam since October 1949. The drainage area tributary to the gage is 62.8 square miles, which is only 4.6 square miles more than that tributary to the dam site. Flows recorded at the gage, therefore, should be only slightly greater than flows at the dam site. Some of the larger flows recorded at the gage have been: 4,010 cfs (October 16, 1955); 2,760 cfs (March 14, 1977); 2,340 cfs (April 2, 1962); and 2,260 cfs (March 19, 1968).

- d. Visual Observations - The pond level was at spillway crest at the time of inspection. The millrace and downstream channel appeared to be in good hydraulic condition, with the exception of some vegetation in the river bed.

e. Test Flood Analysis - Based on the Corps of Engineers guidelines, the recommended test flood for the size (small) and hazard potential (significant) is between the 100-year flood and one-half of the Probable Maximum Flood (PMF). The 1/4 PMF was adopted as the test flood and was determined using Corps of Engineers guidelines for "Estimating Maximum Probable Discharge" in Phase I Dam Safety Investigations. The watershed terrain is characterized as rolling, and a PMF inflow rate of 1,100 cubic feet per second (cfs) per square mile was adopted for the 58.3-square-mile drainage area. The resulting test-flood inflow is 16,000 cfs.

Initial surcharge-storage routing of the test-flood inflow through Harbor Pond resulted in a peak test-flood outflow of 14,840 cfs at a surcharge pond stage of 275.9 feet above NGVD. Stage discharge relationships, presented in Appendix D, include the discharge capacity of the millrace. Due to the indicated tailwater elevation of 275.7, further analysis was performed to account for submergence. The subsequent surcharge-storage routing resulted in a peak test-flood outflow of 14,610 cfs at a surcharge pond stage of 277.5 feet above NGVD. At this stage, which is 10.2 feet above the spillway crest, the dam will be overtopped by 7.5 feet. The spillway capacity at test flood is approximately 6,320 cfs, and the tailwater elevation is approximately 275.0.

f. Dam Failure Analysis - Dam failure analysis was performed in order to assess the downstream hazards in the event of dam failure. A peak failure outflow of approximately 3,130 cfs was estimated based on a breach width of approximately 37 feet and with the pond at the top of the dam (270.0 feet above NGVD), which is 2.7 feet above the spillway crest. Water flowing 2.7 feet deep over the spillway is equivalent to a flow of 1,430 cfs. Such a wet-weather flow would produce flooding conditions downstream prior to dam failure. While this flooding would not be expected to endanger lives downstream, it is estimated that the sudden release of an additional 1,700 cfs in a dam failure would severely damage the building on the left bank just downstream of the South Harbor Road bridge with potential loss of a few lives. Approximately 1.6 miles downstream, a building on Trout Brook in the right flood plain of the Squannacook River would also be flooded by the dam-failure flow. Accordingly, Townsend Harbor Dam is classified as having a "significant" hazard potential.

## SECTION 6: STRUCTURAL STABILITY

### 6.1 Evaluation of Structural Stability

- a. Visual Observation - There was no visible evidence of spillway or dam embankment instability during the site examination of 15 November 1978. The observed locations of slight seepage at the right end of the spillway and under the old grist mill building showed no evidence of soil movement, and are not considered to pose an immediate hazard to the stability of the downstream faces of the embankments.
- b. Design and Construction - There are neither design drawings nor construction data which would show the embankment cross sections or the physical properties of the materials in the embankments. Thus, theoretical analyses of the structural stability of the dam embankments are not possible.

The embankments have had a long period of service, and, in the absence of seepage or erosion problems, would be expected to be adequately stable under static loading conditions.
- c. Operating Records - No operating records, other than state and county inspection reports, were located.
- d. Post-Construction Changes - The dam was constructed in 1870 (the date inscribed on the face of the spillway) to provide additional power for the Spaulding Leatherboard Company. The presence of a concrete millrace, concrete control structures and grouted stone-masonry walls upstream of the spillway further indicate that post-construction changes have been made to the dam.
- e. Seismic Stability - The dam is located in seismic zone No. 2 and, in accordance with recommended Phase I Guidelines, does not warrant seismic analysis.

## SECTION 7: ASSESSMENTS, RECOMMENDATIONS AND REMEDIAL MEASURES

### 7.1 Dam Assessment

- a. Condition - The visual examination of the Townsend Harbor Dam and dike embankments did not reveal any evidence of failure or conditions which would warrant urgent remedial treatment. However, because of the need for maintenance and additional investigations that are outlined hereinafter and the limited capacity of the spillway, the project is considered to be in only fair condition.
- b. Adequacy of Information - All of the information for the Phase I Investigation had to be obtained from visual examination and limited measurements at the site. This information has been sufficient for the purpose of this investigation, but it does not permit detailed evaluation of stability or seepage.
- c. Urgency - The recommended additional investigations and remedial measures outlined in Sections 7.2 and 7.3, respectively, should be undertaken within one year of receipt of the report by the Owner.
- d. Need for Additional Investigations - Additional investigations should be performed by the Owner as outlined in the following section.

### 7.2 Recommendations - It is recommended that the Owner engage a registered professional engineer to perform the following additional investigations:

1. A detailed hydrologic-hydraulic investigation to determine the adequacy of the spillway and any necessary modifications to the facility to provide adequate capacity, taking into account the submergence of the dam.
2. An investigation of the millrace geometry, controls and operation to determine a practicable means of protection against over-topping and subsequent erosion damage to the millrace dike.
3. An investigation of the seepage that is emerging from under the old grist mill building and at the masonry wall to the right of the spillway, to determine what corrective or control measures may be necessary.

### 7.3 Remedial Measures

- a. Operation and Maintenance Procedures - It is recommended that the following remedial work be undertaken by the Owner, in addition to the investigations outlined in Section 7.2, to correct deficiencies noted during the visual examination:
  - (1) Clear brush, trees and debris from the dam and dike embankments including stump removal and backfilling, and cut grass

and weeds on the embankments at least once a year. Clearing of the gradual slope below the millrace dike downstream wall is not necessary beyond 10 ft. from the wall.

- (2) Restore displaced apron stones at the downstream face of the spillway.
- (3) Fill area of local erosion in the right embankment at the end of the short downstream masonry wall and bring crest of embankment behind the wall to grade.
- (4) Reset displaced stones in right downstream flared stone masonry wall.
- (5) Restore low and eroded areas in the millrace dike embankment and re-establish vegetative cover. Work on the millrace dike would be subject to the results of the millrace investigation under Section 7.2.
- (6) Clear brush from channel immediately downstream of spillway.
- (7) Place additional stone protection or dumped riprap in depression at discharge end of millrace overflow spillway.
- (8) Establish a formal maintenance program, operational procedures and emergency preparedness plan and warning system.

The Owner should continue his program of technical inspections. These inspections should be made at least at yearly intervals.

#### 7.4 Alternatives - There are no practical alternatives recommended.

REPORT  
UPON  
TOWNSEND HARBOR DAM  
TOWNSEND HARBOR, MASSACHUSETTS

General

The Townsend Harbor Dam across the Squannacook River is located at Townsend Harbor about 200 feet southwest of the intersection of Main Street and Harbor Road. The dam is an over-flow type structure of stone masonry construction. The dam is not used for any purpose. A canal, about 100 feet from the left abutment of the dam, runs parallel to the river. The entrance to the canal is just upstream from the left dam abutment. A Boston and Maine Railroad track runs parallel to the canal about 70 feet from the left end of the dam.

The spillway is about 6.2 feet high and 92 feet long. The depth of the spillway at the crest is 4.5 feet. Due to the elevation of the top of the left upstream abutment wall being 1.7 feet lower, the effective depth at the spillway crest is 2.8 feet. The structure is a triangular crested type with the upstream face sloping downward and upstream at the rate of 0.09 feet to the foot. The downstream face is vertical.

The abutment walls are of stone masonry, 2 feet thick. The left abutment wall forms a right angle about 20 feet upstream from the dam, runs parallel to the intake of the canal and connects to an abutment of a railroad bridge over the canal intake.

The right abutment is U shaped. Training walls lead downstream from the abutments.

A frame building, named "The Cooperage" and used as a gift shop, is located about 12 feet downstream from the dam on the left bank. The structure extends over the stream from the top of the training wall for a distance of about 9 feet.

Conclusions and Recommendations.

1. The present spillway capacity of the dam is about one-seventh the Rare Flood Flow as determined by the Kinnison-Colby Formula.

2. The dam may be protected by the following method:

- a. Raise the tops of all abutment walls at and upstream from the dam to El. 272.1.
- b. Extend the right abutment to meet the ground at El. 272.1.
- c. Protect the abutments with stone riprap.

Spillway Capacity and Flood Flows

The capacity of the 92 ft. long spillway is estimated to be 1290 c.f.s. without provision for freeboard. The canal can divert a flow of about 130 c.f.s. making a total of 1420 c.f.s. The tributary drainage area is 60.6 square miles. The maximum flood flow as estimated from the Kinnison-Colby Formula (Rare Floods) is about 9000 c.f.s. This rate of flow is about 7 times the discharge capacity of the spillway and about 6-1/2 times the combined discharge capacities of the spillway and canal.

It is possible that during a flood, the waterways between the trestlebents of the railroad bridge over the entrance to the canal would become blocked with debris so that diversion of water by the canal would become negligible.

In order for the spillway to discharge the entire estimated rare flood flow of 9000 c.f.s., the head on the spillway crest would have to be increased to 10.4 feet. Due to the location and grade of the railroad trestle bridge there appears to be no practical way to accomplish this by raising the height of the walls on the left abutment. The right abutment wall would have to be increased 5.9 feet in height and extended to Harbor Road.

If the tops of all the abutment walls were raised to El. 272.1, or the elevation of the top of the railroad bridge abutments, the capacity of the spillway could be increased to about 2900 c.f.s. or about 2-1/4 times the present capacity. The right abutment walls could either be extended into the hillside slope or a short earth embankment could be constructed in place of the wall extension.

#### Stability and Repairs

The stability of the structure is adequate. The condition of the dam is good.

In order to obtain a substantial increase in spillway capacity, the tops of all abutment walls upstream from the dam should be raised to El. 272.1. These walls would be raised 0.3 feet except the upstream left abutment wall which would be raised 2.0 feet. On the right abutment the raised wall should

either be extended a few feet into the hillside slope or connected to the slope with an earth dike. The abutments on both sides of the dam should be protected with stone riprap. On the left abutment this stone protection may be in the form of stone paving on the ground behind the walls for a distance of at least 10 feet from the backface of the wall. On the right abutment the junction of the ground with the end of the extended wall together with the ground on the downstream face of the wall should be protected with dumped stone riprap. If a connecting earth dike is used, it should be completely covered with stone.

DATE 5/22/79      COMPUTED BY PFH

### SIZE CLASSIFICATION

Height :	Top of dam	EI. 270.0
	Toe of dam	EI. 259.0
		11.0

Storage at top of dam :

Dead Storage	(below spillway)	116 acre-feet
Surcharge Storage	(to top of dam)	157 acre-feet
		273 acre-feet

∴ Size Classification is SMALL

### DAM FAILURE ANALYSIS

$$Q_{p_1} = \left[ \frac{g}{27} \right] W_b \sqrt{g} Y_0^{3/2} + [0.6 CLH^{3/2}]$$

$$W_b = 37', Y_0 = 11', C = 3.5, L = 92.2', H = 2.7'$$

$$Q_{p_1} = \left[ \frac{g}{27} \right] (37) \left( 32.2 \right)^{1/2} (11)^{3/2} + [0.6 \times 3.5 \times 92.2 \times (2.7)^{3/2}] = 3,130 \text{ cfs}$$

First downstream reach: From dam to South Harbor Rncl

Elevation	Discharge (cfs)	Storage (ac-ft)
260	0	0
262	295	1.5
264	905	3.0
266	1,730	4.4
268	2,715	5.9
270	3,850	7.4

Stage in 1<sup>st</sup> reach when outflow is 3,130 cfs is :

$$268 + \left[ \frac{3,130 - 2,715}{3,850 - 2,715} \right] [270 - 268] = 268.7$$

Storage in 1<sup>st</sup> reach at EI. 268.7 is :

$$5.9 + \left[ \frac{268.7 - 268.0}{270.0 - 268.0} \right] [7.4 - 5.9] = 6.4 \text{ ac-ft} = V_1$$

$$Q_{p_2} = Q_{p_1} \left( 1 - \frac{V_1}{S} \right) = 3,130 \left( 1 - \frac{6.4}{273} \right) = 3,060 \text{ cfs}$$

Stage in 1<sup>st</sup> reach when outflow is 3,060 cfs is :

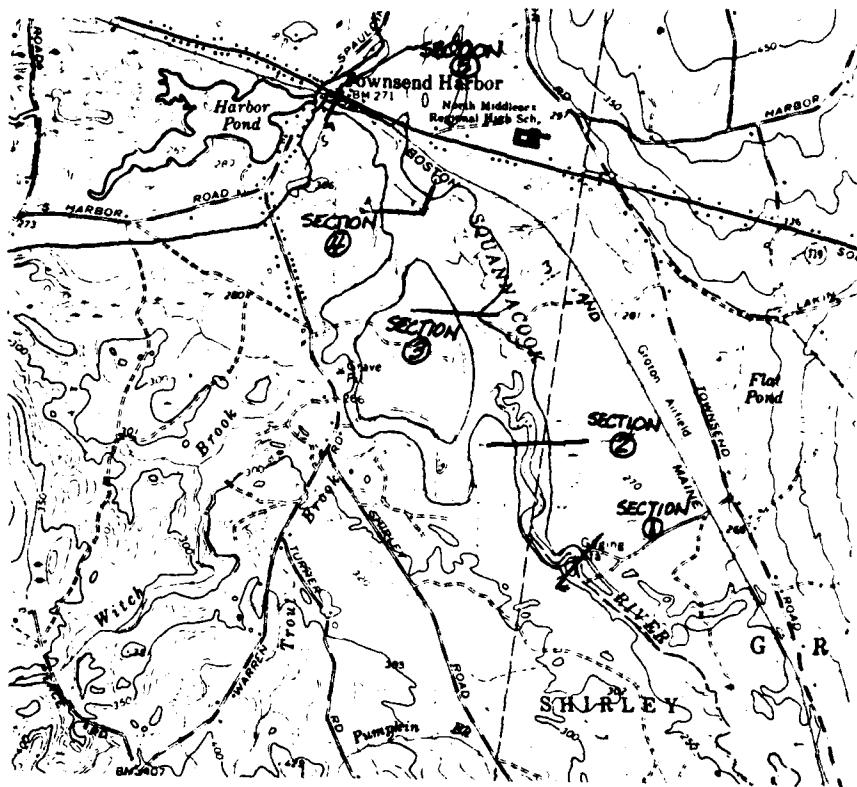

$$268 + \left[ \frac{3,060 - 2,715}{3,850 - 2,715} \right] [270 - 268] = 268.6$$

DATE CHECKED 6-6-79  
CHECKED BY JED

PAGE 2 of 14  
DATE 5/22/79  
COMPUTED BY PFH

Storage in 1<sup>st</sup> reach at El. 268.6 is:

$$5.9 + \left[ \frac{268.6 - 268.0}{270.0 - 268.0} \right] \left[ 7.4 - 5.9 \right] = 6.4 \text{ ac.-ft} = V_2$$

$$V_3 = \frac{V_1 + V_2}{2} = 6.4 \text{ ac.-ft.}$$

$Q_{P_3} = Q_{P_2} = 3,060 \text{ cfs} = \text{Outflow from 1<sup>st</sup> reach}$

Stage in 1<sup>st</sup> reach when outflow is 3,060 cfs is 268.6.  
No buildings in the 1<sup>st</sup> reach would be affected by the  
dam-failure flood, but a building on the left bank  
just downstream of the bridge would be severely  
damaged and its occupants could be killed.

Second downstream reach: From South Harbor Rd. to Millrace Outlet

Discharge from millrace at dam failure (El. 270):

$$Q = [C_1 A_1 \sqrt{2g H_1}] + [C_2 L_2 H_2^{3/2}] + [C_3 L_3 H_3^{3/2}]$$

$$\text{Outlet orifice: } C_1 = \left[ 1 + 0.4 R^{0.3} + \frac{0.0045 L}{R^{1.18}} \right]^{-1/2}$$

$$C_1 = \left[ 1 + (0.4) \left( \frac{3.9' + 2.8'}{(2)(3.9' + 2.8')} \right)^{0.3} + \left( \frac{0.0045 \times 2'}{0.82^{1.18}} \right) \right]^{-1/2} = 0.85$$

$$A_1 = 3.9' \times 2.8' = 10.92 \text{ ft}^2$$

$$H_1 = 270.0 - 266.4 = 3.6'$$

Emergency spillway:  $C_2 = 2.8$ ,  $L_2 = 18'$ ,  $H_2 = 1.9'$

Right bank:  $C_3 = 2.6$ ,  $L_3 = 44.4'$ ,  $H_3 = 0.8'$

$$Q = [(0.85)(10.92)(2.8)^{3/2}] + [(2.8)(18)(1.9)^{3/2}] + [(2.6)(44.4)(0.8)^{3/2}] = 360 \text{ cfs}$$

$$Q_{P_1} = [Q_{P_3} \text{ from 1<sup>st</sup> reach}] + [360 \text{ cfs}] = 3,060 + 360 = 3,420 \text{ cfs}$$

Elevation	Discharge(cfs)	Storage(ac-ft)
260	0	0
262	500	1.1
264	1,700	2.2
266	3,560	3.3

Stage-Discharge-Storage  
Relationships at Channel Cross  
Section at Millrace Outlet

Stage in 2<sup>nd</sup> reach when outflow is 3,420 cfs is:

$$264 + \left[ \frac{3,420 - 1,700}{3,560 - 1,700} \right] [266 - 264] = 265.8$$

Storage in 2<sup>nd</sup> reach at El. 265.8 is:

$$2.2 + \left[ \frac{265.8 - 264}{266 - 264} \right] [3.3 - 2.2] = 3.2 \text{ ac.-ft.} = V_1$$

COMPUTED BY PFH

$$Q_{p_2} = Q_{p_1} \left(1 - \frac{V}{S}\right) = 3,420 \left(1 - \frac{3.2}{273}\right) = 3,380 \text{ cfs}$$

Stage in 2<sup>nd</sup> reach when outflow is 3,380 cfs is:

$$264 + \left[ \frac{3,380 - 1,700}{3,560 - 1,700} \right] [266 - 264] = 265.8$$

Storage in 2<sup>nd</sup> reach at El. 265.8 = 3.2 ac.-ft. = V<sub>2</sub>

$$\therefore V_1 = V_2 = V_3 \implies Q_{p_3} = Q_{p_2} = 3,380 \text{ cfs} = \text{Outflow from 2<sup>nd</sup> reach}$$

No buildings in 2<sup>nd</sup> reach, except for the one just downstream of South Harbor Road referred to above, would be affected by dam-failure flood.

Third downstream reach: From Millrace Outlet to Cross Section 4

$$Q_{p_1} = 3,380 \text{ cfs} \text{ (From 2<sup>nd</sup> reach)}$$

Elevation	Discharge (cfs)	Storage (ac.-ft.)
256.4	0	0
260.0	920	16.5
261.0	1,640	39.9
262.0	3,010	63.3
263.0	5,635	86.8

Stage in 3<sup>rd</sup> reach when outflow is 3,380 cfs is:

$$262 + \left[ \frac{3,380 - 3,010}{5,635 - 3,010} \right] [263 - 262] = 262.1$$

Storage in 3<sup>rd</sup> reach at El. 262.1 is:

$$63.3 + \left[ \frac{262.1 - 262.0}{263.0 - 262.0} \right] [86.8 - 63.3] = 65.6 \text{ ac.-ft.} = V_1$$

$$Q_{p_2} = Q_{p_1} \left(1 - \frac{V}{S}\right) = 3,380 \left(1 - \frac{65.6}{273}\right) = 2,570 \text{ cfs}$$

Stage in 3<sup>rd</sup> reach when outflow is 2,570 cfs is:

$$261 + \left[ \frac{2,570 - 1,640}{3,010 - 1,640} \right] [262 - 261] = 261.7$$

Storage in 3<sup>rd</sup> reach at El. 261.7 is:

$$39.9 + \left[ \frac{261.7 - 261.0}{262.0 - 261.0} \right] [63.3 - 39.9] = 56.3 \text{ ac.-ft.} = V_2$$

$$V_3 = \frac{V_1 + V_2}{2} = \frac{65.6 + 56.3}{2} = 61.0 \text{ ac.-ft}$$

$$Q_{p_3} = 3,380 \left(1 - \frac{61}{273}\right) = 2,625 \text{ cfs} = \text{Outflow from 3<sup>rd</sup> reach}$$

Stage in 3<sup>rd</sup> reach when outflow is 2,625 cfs is:  

$$261 + \left[ \frac{2,625 - 1,640}{3,010 - 1,640} \right] [262 - 261] = 261.7$$

No buildings in 3<sup>rd</sup> reach affected by dam-failure flood.

Fourth downstream reach : From Cross Section 4 to Cross Section 3

$$Q_{p_1} = 2,625 \text{ cfs} \text{ (From 3<sup>rd</sup> reach)}$$

Elevation	Discharge (cfs)	Storage (ac-ft)
252	0	0
254	310	48.7
255	910	73.0
256	1,960	97.4
257	3,540	121.7

Stage in 4<sup>th</sup> reach when outflow is 2,625 cfs is:  

$$256 + \left[ \frac{2,625 - 1,960}{3,540 - 1,960} \right] [257 - 256] = 256.4$$

Storage in 4<sup>th</sup> reach at El. 256.4 is:

$$97.4 + \left[ \frac{256.4 - 256.0}{257.0 - 256.0} \right] [121.7 - 97.4] = 107.1 \text{ ac.-ft.} = V_1$$

$$Q_{p_2} = Q_{p_1} \left( 1 - \frac{V_1}{S} \right) = 2,625 \left( 1 - \frac{107.1}{273} \right) = 1,595 \text{ cfs}$$

Stage in 4<sup>th</sup> reach when outflow is 1,595 cfs is:

$$255 + \left[ \frac{1,595 - 910}{1,960 - 910} \right] [256 - 255] = 255.6$$

Storage in 4<sup>th</sup> reach at El. 255.6 is:

$$73.0 + \left[ \frac{255.6 - 255.0}{256.0 - 255.0} \right] [97.4 - 73.0] = 87.6 \text{ ac.-ft.} = V_2$$

$$V_3 = \frac{V_1 + V_2}{2} = \frac{107.1 + 87.6}{2} = 97.4 \text{ ac.-ft.}$$

$$Q_{p_3} = 2,625 \left( 1 - \frac{97.4}{273} \right) = 1,690 \text{ cfs} = \text{Outflow from 4<sup>th</sup> reach}$$

Stage in 4<sup>th</sup> reach when outflow is 1,690 cfs is:

$$255 + \left[ \frac{1,690 - 910}{1,960 - 910} \right] [256 - 255] = 255.7$$

No buildings in 4<sup>th</sup> reach affected by dam-failure flood.

CAMP DRESSER & MCKEE CLIENT COE JOB NO 380-5-11 PAGE 5 of 14  
 Environmental Engineers PROJECT Dam Inspection DATE 5/24/79  
 Boston, Mass. DETAIL Townsend Harbor Dam CHECKED BY WED COMPUTED BY PFH

Fifth downstream reach: From Cross Section 3 to Cross Section 2

$$Q_{p_1} = 1,690 \text{ cfs} \text{ (From 4th reach)}$$

Elevation	Discharge(cfs)	Storage(ac-ft)
247.7	0	0
250.0	250	5.8
251.0	635	49.6
252.0	1,460	93.5
253.0	2,995	137.4

Stage in 5<sup>th</sup> reach when outflow is 1,690 cfs is :

$$252 + \left[ \frac{1,690 - 1,460}{2,995 - 1,460} \right] [253 - 252] = 252.2$$

Storage in 5<sup>th</sup> reach at El. 252.2 is :

$$93.5 + \left[ \frac{252.2 - 252.0}{253.0 - 252.0} \right] [137.4 - 93.5] = 102.3 \text{ ac.-ft} = V_1$$

$$Q_{p_2} = Q_{p_1} \left( 1 - \frac{V_1}{S} \right) = 1,690 \left( 1 - \frac{102.3}{273} \right) = 1,055 \text{ cfs}$$

Stage in 5<sup>th</sup> reach when outflow is 1,055 cfs is :

$$251 + \left[ \frac{1,055 - 635}{1,460 - 635} \right] [252 - 251] = 251.5$$

Storage in 5<sup>th</sup> reach at El. 251.5 is :

$$49.6 + \left[ \frac{251.5 - 251.0}{252.0 - 251.0} \right] [93.5 - 49.6] = 71.6 \text{ ac.-ft.} = V_2$$

$$V_3 = \frac{V_1 + V_2}{2} = \frac{102.3 + 71.6}{2} = 87.0 \text{ ac.-ft.}$$

$$Q_{p_3} = 1,690 \left( 1 - \frac{87}{273} \right) = 1,150 \text{ cfs} = \text{Outflow from 5<sup>th</sup> reach}$$

Stage in 5<sup>th</sup> reach when outflow is 1,150 cfs is :

$$251 + \left[ \frac{1,150 - 635}{1,460 - 635} \right] [252 - 251] = 251.6$$

A building on Trout Brook in the right flood plain of the Squannacook River would probably be affected by a dam failure flood stage at El. 251.6.

Sixth downstream reach: At USGS Gage No. 01096000

$$Q_{p_1} = 1,150 \text{ cfs} \text{ (From 5<sup>th</sup> reach)}$$

$$249 + \left[ \frac{1,150 - 640}{1,220 - 640} \right] [250 - 249] = 249.9$$

Storage in 6<sup>th</sup> reach at El. 249.9 is :

$$19.5 + \left[ \frac{249.9 - 249.0}{250.0 - 249.0} \right] [23.6 - 19.5] = 23.2 \text{ ac.-ft.} = V_1$$

$$Q_{P_2} = Q_{P_1} \left( 1 - \frac{V_1}{S} \right) = 1,150 \left( 1 - \frac{23.2}{273} \right) = 1,050 \text{ cfs}$$

Stage in 6<sup>th</sup> reach when outflow is 1,050 cfs is :

$$249 + \left[ \frac{1,050 - 640}{1,220 - 640} \right] [250 - 249] = 249.7$$

Storage in 6<sup>th</sup> reach at El. 249.7 is :

$$19.5 + \left[ \frac{249.7 - 249.0}{250.0 - 249.0} \right] [23.6 - 19.5] = 22.4 \text{ ac.-ft} = V_2$$

$$V_3 = \frac{V_1 + V_2}{2} = \frac{23.2 + 22.4}{2} = 22.8 \text{ ac.-ft.}$$

$$Q_{P_3} = 1,150 \left( 1 - \frac{22.8}{273} \right) = 1,055 \text{ cfs} = \text{Outflow from 6<sup>th</sup> reach}$$

Stage in 6<sup>th</sup> reach when outflow = 1,055 cfs is :

$$249 + \left[ \frac{1,055 - 640}{1,220 - 640} \right] [250 - 249] = 249.7$$

No buildings in 6<sup>th</sup> reach affected by dam-failure flood.

A flow of 1,055 cfs is expected to be equaled or exceeded at the gage an average of once every 17 months. There is a 70 percent chance that it will be equaled or exceeded in any given year. This flow is not expected to cause any damage downstream of the gage.

The dam failure analysis indicates that 2 buildings may be affected by the dam failure flood. The estimated potential loss of life is a few persons.

∴ SIGNIFICANT HAZARD

TEST FLOOD : 100-Yr. to  $\frac{1}{2}$  PMF Range ; Use  $\frac{1}{4}$  PMF

From COE Guideline Curves for Rolling Terrain use 1,100 cfs/m<sup>2</sup>

$$\text{Test Flood} = \left( \frac{1}{4} \right) (1,100 \text{ cfs/m}^2) (58.3 \text{ mi}^2) = 16,000 \text{ cfs}$$

### Discharges at Millrace Entrance (Railroad Bridge)

#### 1. Open-channel flow below El. 269.7

The discharge is equal to that at the downstream end of the millrace, but the pond water surface elevation equals the water surface elevation at the downstream end of the millrace plus the millrace head loss.

#### 2. Orifice flow above El. 269.7, operating under outlet control.

$$\text{Area} = 16.3' \times 6.6' = 107.6 \text{ ft}^2$$

$$\text{Wetted Perimeter} = (2)(16.3' + 6.6') = 45.8'$$

$$R = (107.6) \div (45.8) = 2.35$$

$$K = 1.5 + \frac{29 n^2 L}{R^{9/5}} = 1.5 + \frac{(29)(0.020)^2 (11.5')}{(2.35)^{9/5}} = 1.54$$

$$Q_o = A \sqrt{\frac{2g H}{K}} = (107.6) \sqrt{\frac{64.4(H)}{(1.54)}} = 695.8 \sqrt{H}$$

H is the difference between water surface elevation upstream and downstream of the railroad bridge.

### Surcharge - Storage Routing Through Harbor Pond

$Q_p =$  Test flood inflow = 16,000 cfs (From page 6)

Stage when outflow is 16,000 cfs is El. 276.2

Storage at El. 276.2 is 2,243 ac.-ft.

Runoff Volume =  $\frac{2,243 \text{ ac.-ft.}}{(58.25 \text{ mi}^2)(53.3 \frac{\text{ac.-ft.}}{\text{inch} \cdot \text{mi}^2})} = 0.72 \text{ " runoff}$

1/4 PMF runoff volume = 5"

$Q_p = Q_p \left(1 - \frac{V_1}{S}\right) = 16,000 \left(1 - \frac{0.72 \text{ "}}{5 \text{ "}}\right) = 13,700 \text{ cfs}$

Stage when outflow is 13,700 cfs is El. 275.6

Storage at El. 275.6 is 2,058 ac.-ft.

Avg. Storage =  $\frac{2,243 + 2,058}{2} = 2,150 \text{ ac.-ft.}$

Stage when storage is 2,150 ac.-ft. is 275.9

Outflow at El. 275.9 is 14,840 cfs

### Tailwater Analysis

Determine tailwater elevation at upstream face of South Harbor Road bridge. The river channel discharge between the dam and the bridge comes principally from the spillway and right embankment.

$$Q = \left[ (3.5)(92.2)(275.9 - 267.3)^{3/2} \right] + \left[ (2.3)(92.2)(275.9 - 270.0)^{3/2} \right] = 11,180 \text{ cfs}$$

Water surface elevation at downstream face of South Harbor Road bridge is approximately the same as that at the confluence of the millrace discharge channel with the river channel, at which point the river flow is the entire test flood outflow, 14,840 cfs.

At millrace outlet:

Elevation	Discharge (cfs)
270	9,535
271	10,070
272	11,485
273	13,670
274	16,600

Stage when discharge is 14,840 cfs is:

$$273 + \frac{14,840 - 13,670}{16,600 - 13,670} [274 - 273] = 273.4$$

CAMP DRESSER & MCKEE CLIENT COE JOB NO 300-5-11 PAGE 13 of 14

 Boston, Mass. PROJECT Dam Inspection CHECKED BY JED COMPUTED BY PFH  
 DETAIL Townsend Harbor Dam

Balance orifice and weir flow at South Harbor Road bridge

1. Orifice under outlet control (Crown El. 270.4)

$$\text{Area} = (10.4' \times 83') = 863.2 \square$$

$$\text{Wetted Perimeter} = (2 \times 10.4' + 83') = 186.8'$$

$$R = (863.2) / (186.8) = 4.62'$$

$$\text{Length} = 30'$$

$$n = 0.050$$

$$K = 1.5 + \frac{29 n^2 L}{R^{4/5}} = 1.5 + \frac{(29)(0.050)^2 (30')}{(4.62)^{4/5}} = 1.78$$

$$Q_o = A \sqrt{\frac{2g H_o}{K}} = 863.2 \square \sqrt{\frac{(64.4) H_o}{1.78}} = 5,192 \sqrt{H_o}$$

2. Weir at El. 274: Length = 200', C = 3.0,  $Q_w = CL H_w^{3/2}$

Stage - Area Relationships:

Elevation	Area ( $\square$ )
270.4-274	863.2
275	1,063.2
276	1,263.2
277	1,463.2

①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩	⑪
Assumed Q <sub>w</sub>	H <sub>w</sub>	USEL	Area at USEL	Velocity, Head	Velocity Head	Energy Grade Line	H <sub>o</sub>	Q <sub>o</sub>	Computed Q <sub>w</sub>	Assume New Q <sub>w</sub>
①/600 <sup>1/2</sup>	274+②	From Table Above	11,180/④	⑤ <sup>2/3</sup> /⑨	③+⑥	⑦-2734	5192-⑧ <sup>2</sup>	11,180-⑦		
1,330	1.7	275.7	1,203.2	9.3	1.3	277.0	3.6	9,850	1,330	OK
For Submerged Conditions: (See next page)										
			1,9530/④			⑦-2733		9,530-⑦		
540	0.9	274.9	1,043.2	9.1	1.3	276.2	2.9	8,840	690	560
560	1.0	275.0	1,063.2	9.0	1.3	276.3	3.0	8,990	540	OK

Tailwater El. 275.7 indicates that the dam is submerged. In order to account for submergence at the dam, reduce the discharges at the spillway and right embankment.

Assume submergence ratio = 0.75 Reduce free-flow discharges 40%

Elev.	Spillway		Right Embankment		Total Submerged Discharge	Left Embank- ment	Railroad Bridge	Total Discharge
	Free Discharge	Submerged Discharge	Free Discharge	Submerged Discharge

### Surcharge - Storage Routing With Submergence

Stage when outflow is 16,000 cfs is El. 278  
Storage at El. 277.8 is 2,800 ac.-ft.

$$\text{Runoff Volume} = \frac{2,800}{(58.25)(53.3)} = 0.9 \text{ " runoff}$$

$$Q_{p_2} = 16,000 \left(1 - \frac{0.9}{5}\right) = 13,120 \text{ cfs}$$

Stage when outflow is 13,120 cfs is El. 277  
Storage at El. 277 is 2,491 ac.-ft.

$$\text{Avg. Storage} = \frac{2,800 + 2,491}{2} = 2,646 \text{ ac.-ft.}$$

Stage when storage is 2,646 ac.-ft. is 277.5  
Outflow at El. 277.5 is 14,610 cfs

### Tailwater Analysis With Submergence

Stage at downstream face of South Harbor Road bridge  
when discharge at confluence with millrace outlet is  
14,710 cfs is :

$$273 + \frac{[14,610 - 13,670]}{[16,600 - 13,670]} [274 - 273] = 273.3$$

Discharge at spillway and right embankment :

$$Q = 8,560 + \frac{[277.5 - 277.0]}{[278.0 - 277.0]} [10,500 - 8,560] = 9,530 \text{ cfs}$$

Tailwater elevation for submerged conditions  
is El. 275.0. (See tabular balance of orifice and  
weir flow on previous page)

$$\text{Check submergence ratio : } \frac{(275.0 - 267.3)}{(277.5 - 267.3)} = 0.76 \text{ OK}$$

Test-Flood Outflow = 14,610 cfs at El. 277.5

The test flood overtops the dam by 7.5' and the  
spillway by 10.2'.

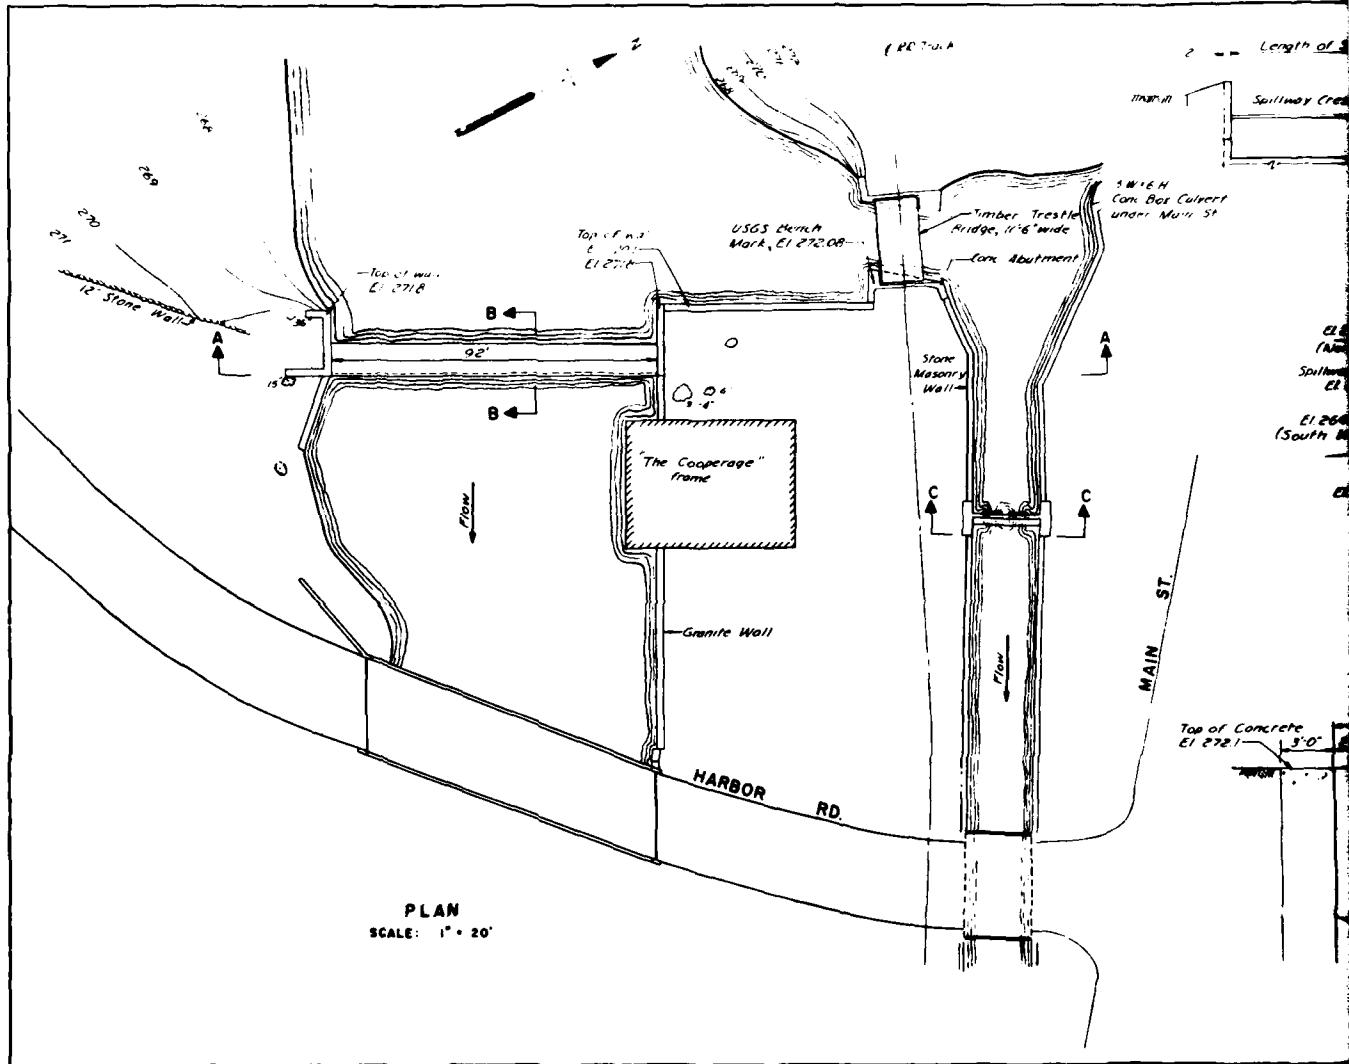

Tailwater Elevation is 275.0

Spillway capacity at test flood elevation :

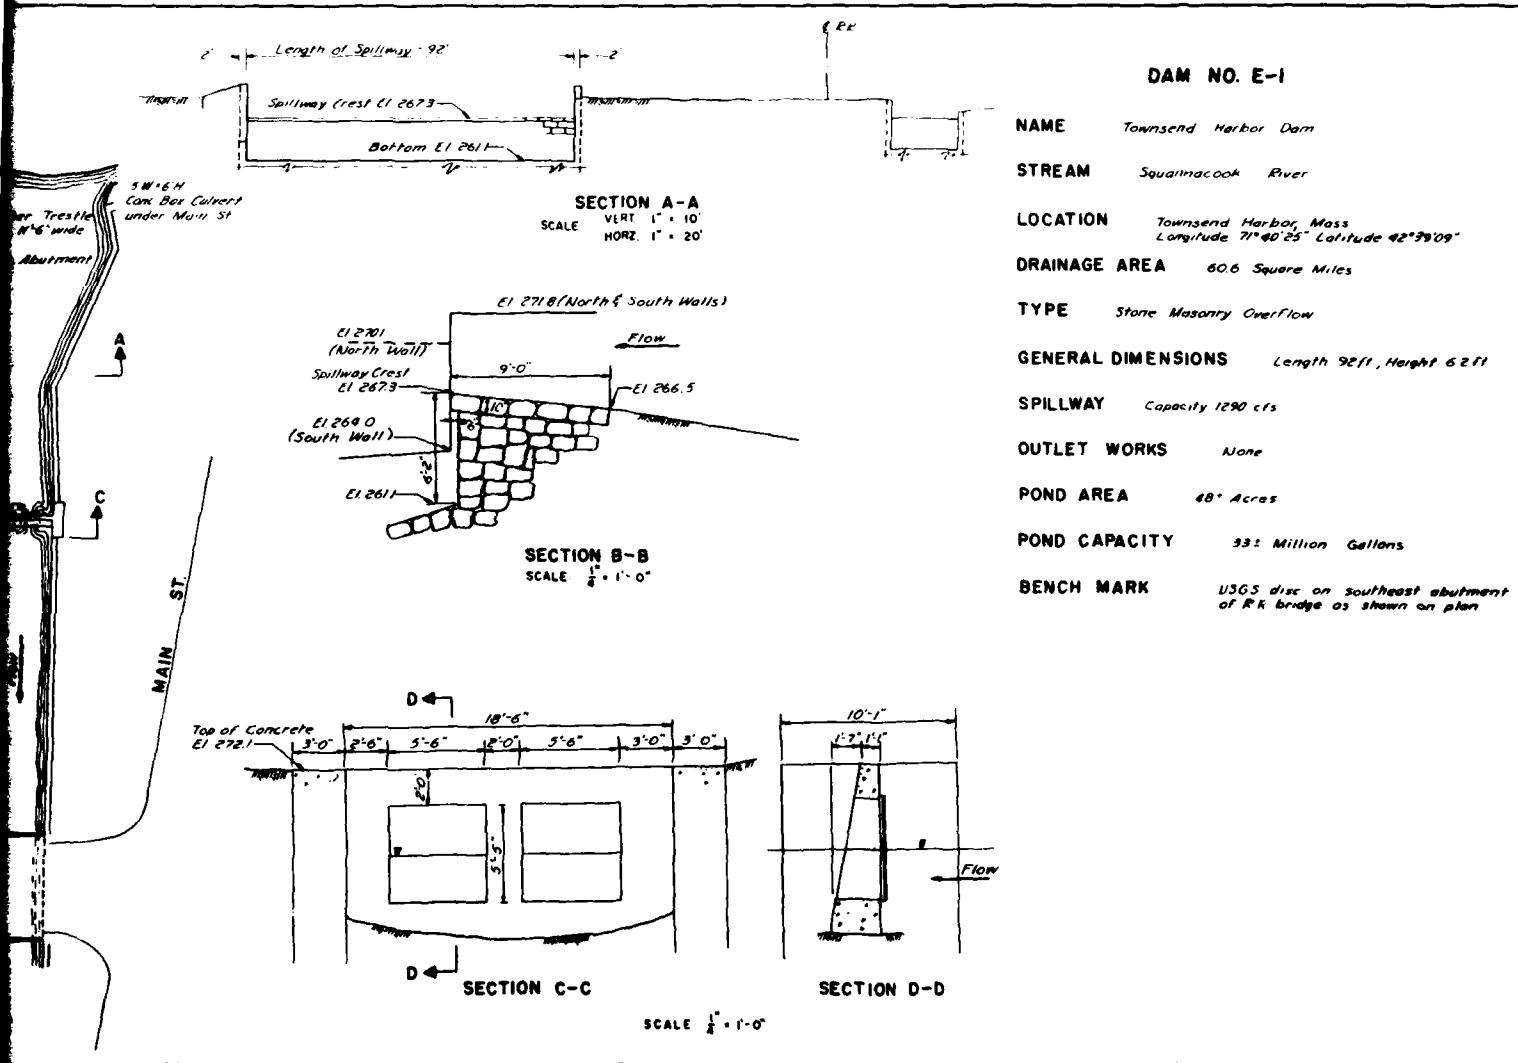

$$5,850 + \frac{[277.5 - 277.0]}{[278.0 - 277.0]} [6,780 - 5,850] = 6,320 \text{ cfs}$$
